

Overview

Whenever Agvance customers wish to allow a 3rd party application to access their data through the Agvance Web API they must perform certain steps to explicitly allow that connection. This is accomplished by creating a new user in the Agvance database for use by the application. This can be done in the Agvance Hub under the menu Setup -> Users. If prompted for a password to access this part of the program, please call SSI to request the password. This new Agvance user can be assigned any role since those roles do not apply to the API. This user should be setup with a strong password. Once the customer has setup this user they must supply the username and password to the application developers or enter that username and password in the appropriate location in the application.

Note that setting up this Agvance user in the database will not require any additional Agvance licenses nor will it incur any additional costs for the customer. Likewise, they do not need to create a new Windows user nor activate an additional Agvance license the way they normally would when setting up a new employee to use Agvance. They only need to create this new user in the Agvance database which can be done by going to the menu item Setup -> Users in the Agvance Hub.
