| Element of the curriculum | | | | | | |
| Physics | | | | | | |
| • Energy: energy changes and transfers, changes in systems | ✓ | | ✓ | | | |
| • Forces: as pushes or pulls | ✓ | ✓ | ✓ | | | |
| • Forces: using force arrows in diagrams, adding forces in one dimension, balanced and unbalanced forces | ✓ | ✓ | ✓ | ✓ | | |
| • Forces: gravity | ✓ | ✓ | ✓ | ✓ | | |
| • Forces: resistance to motion of water | ✓ | | | | | |
| • Forces: measured in newtons | | ✓ | ✓ | | | |
| • Forces: moment as the turning effect of a force | | | ✓ | | | |
| • Forces: associated with deforming objects | | | | ✓ | | |
| • Forces and motion: cause objects to stop or start moving, or to change their speed or direction of motion | ✓ | ✓ | ✓ | | | |
| • Pressure in fluids: pressure in liquids, increasing with depth; upthrust effects, floating and sinking | ✓ | ✓ | | ✓ | | |
| • Pressure in fluids: pressure measured by ratio of force over area | | | | ✓ | | |
| Chemistry | | | | | | |
| • Chemical reactions: oxidation reactions, displacement reactions, catalysts | | | | | ✓ | ✓ |
| • Materials | | | | | ✓ | |
| Biology | | | | | | |
| • Structure and function of living organisms | | | | | | ✓ |
| • Material cycles and energy: cellular respiration | | | | | | ✓ |
| • Interactions and interdependencies: relationships in an ecosystem | | | | | | ✓ |
| Working Scientifically | | | | | | |
| • Scientific attitudes | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ |
| • Experimental skills and investigations | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ |
| • Analysis and evaluation | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ |
| • Measurement | ✓ | ✓ | ✓ | ✓ | ✓ | |

SCHEME OF WORK

Lesson 1: Submarine shape investigation

Overview

This lesson starts off by establishing the story of the whole unit. The students will be using the information learned in the unit to design a submarine for exploring the ocean depths.

The context of the lesson is a practical investigation to discover a suitable shape that can dive and rise at a speed safe enough for the scientists inside the submarine. Students develop their understanding of forces, surface area, and fair testing.

Learning outcomes

- Test different shapes to compare how they fall through the water
- Explain how the shape affects the speed of descent
- Design and carry out a fair test
- Explain how differences in gravitational and resistive forces affect descent of an object
- Explain why surface area affects the speed of descent

Lesson 2: Submarine buoyancy investigation

Overview

This lesson encourages students to investigate hands-on the property of neutral buoyancy, and to discuss its importance in terms of submarines.

There is a practical investigation to achieve neutral buoyancy for a floating object by adding weight. This session also explores the mathematics of density and buoyancy.

Learning outcomes

- Describe how to make floating objects sink
- Make an object neutrally buoyant through experimentation
- Explain how neutral buoyancy is achieved in terms of forces
- Calculate the volume of a spherical object
- Calculate the weight required to make a floating object neutrally buoyant

SCHEME OF WORK

Lesson 3: Submarine launch investigation

Overview

The submarines used for the XL Catlin Deep Ocean Survey were in the strictest sense submersibles. A distinction is made between true submarines that operate independently and submersibles which require the support of a surface vessel.

In this lesson, students develop an understanding of structural strength and stability. They will then design and build a model crane suitable for lifting and moving a weight. This activity replicates the science involved in launching and recovering a submersible using a surface vessel.

Learning outcomes

- Describe the features of a strong and stable structure
- Describe the purpose of each part of a crane's structure
- Construct a working model of a crane
- Calculate the moments of some given examples
- Explain the importance of launching and raising the submarine from the back of a ship, rather than the side

• Submersible recovery

Lesson 4: Submarine pressure investigation

Overview

The operating depth limit for the submersibles used on the XL Catlin Deep Ocean Survey was 1,000 feet. To put this in context, recreational scuba diving has a limit of 130 feet, but the deepest point in the ocean is an astounding 36,070 feet down.

In this lesson, students investigate the effects of pressure increasing with depth, and the implications that this has for submarine design. Get the design wrong and the submarine will implode.

Learning outcomes

- Describe the dangers of exploring at depth
- Explain why pressure increases with depth
- Design and carry out a fair test to investigate the effects of increasing depth
- Calculate the amount of pressure caused at different depths
- Explain, in terms of forces, why submarines have a safe limit to which they can dive

SCHEME OF WORK

Lesson 5: Submarine materials investigation

Overview

Submarines have to operate in difficult environments. First, they need to operate under pressure. Second, they have to cope with the corrosive nature of seawater. Different parts of the submarine will need different materials. There is no point building a submarine for scientific operation out of solid metal.

In this lesson, students will start by reflecting on historical submarine designs and some were not very successful. They will then debate materials choices for building a submarine. A practical investigation looks at how to protect the submarine from rusting.

Learning outcomes

- Describe why several different materials are needed to build a submarine
- Carry out a fair investigation into the effects of salt and water on rusting
- Explain why different conditions cause different amounts of rusting
- Make justified choices for the materials used to build a submarine
- Explain oxidation reactions with balanced equations

Submarine 'rusting' predictions

Mark Scheme 5:
Submarine launch investigation

Lesson 6: Submarine life support investigation

Overview

Researching using submarines means that the scientists are working in an enclosed space deep underwater for hours at a time. This lesson investigates the life support systems needed to keep scientists and explorers alive.

Students will conduct an investigation into how limewater can reduce the amount of carbon dioxide in an atmosphere. Students will then design the life support systems needed for a submarine. The lesson concludes with students compiling all their research from the unit to create a submarine design presentation.

Learning outcomes

- Describe the dangers to explorers in the deep ocean
- Conduct an investigation into respiration
- Describe how respiration occurs and its importance
- Balance the respiration equation
- Explain how submarines are built and engineered to sustain life
