

Breakout group 1

How can current test methods be exploited for potency characterisation?

Moderator: David Basketter

Breakout group 1:

- Those current methods validated/nearly validated in combination are sufficient for potency classification (1A/1B).
- Dose responses are not easily derived from current methods, eg kDPRA, would be helpful.
- A set of selected substances should go through an assessment of the reference data for potency range.
- Those current methods together with other sources of information can be exploited for predicting a NESIL in a WoE way whilst the uncertainties need to be characterised.
- Sharing and analysing of specific case studies will help understand what their applicability domain and acceptability is.
